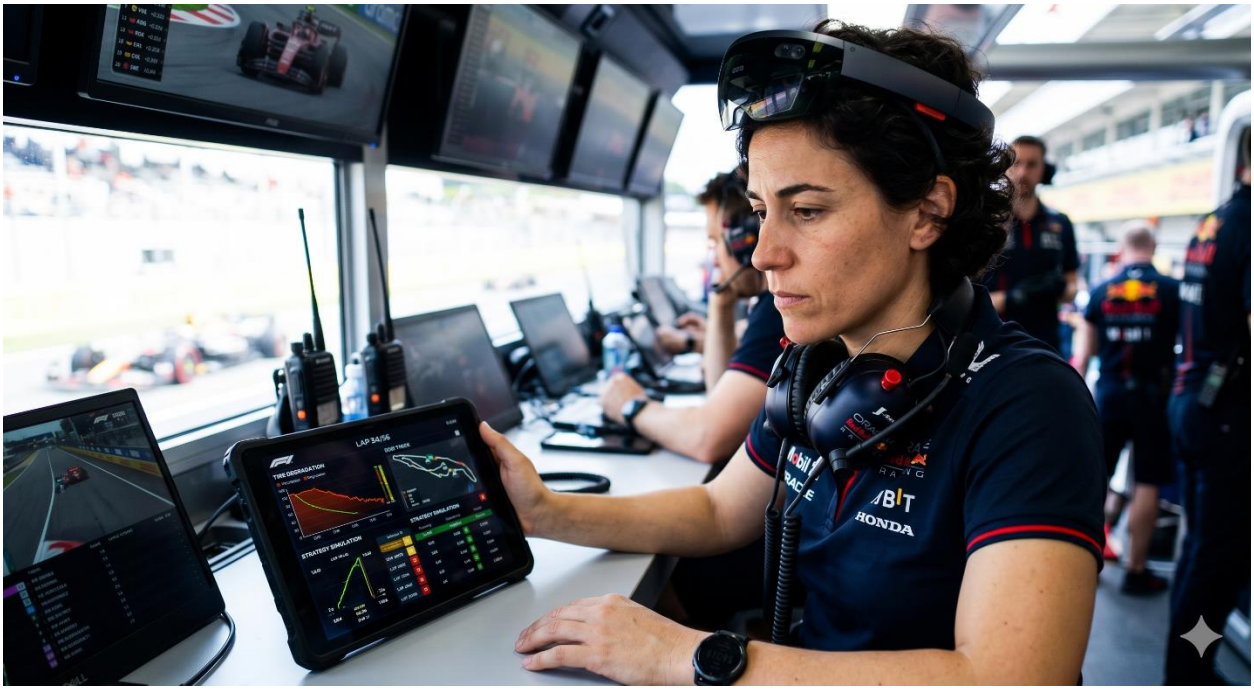
Sofia Martinez: Senior Race Strategist



Sofia Martinez is a 38-year-old Spanish Senior Race Strategist with over 14 years of experience in Formula 1 motorsport strategy. With a background in aerospace engineering and motorsport analytics, she specializes in making high-pressure race decisions based on real-time telemetry, tire degradation, fuel usage, weather conditions, and competitor behavior. She works primarily from the pit-wall command station, where every second and every strategic call can directly impact race results.

Sofia is highly analytical, calm under pressure, and focused on efficiency. She prefers structured dashboards, clear visualizations, and systems that reduce cognitive overload during critical race moments. Rather than relying on intuition alone, she trusts accurate data and collaborative communication with engineers and drivers to guide decisions.

She regularly uses multiple devices throughout race weekends. On her tablet, she monitors live telemetry, tire performance, and competitor pit-stop windows while running quick strategy simulations. Her AR headset allows her to overlay live race data directly onto the track view, helping her stay aware of both physical and digital race events simultaneously. Through her smartwatch, she receives vibration-based emergency alerts, countdowns for pit stops, and quick communication updates from engineers.

Sofia’s main goals are to predict race developments before rival teams, reduce reaction time during safety cars or sudden weather changes, and maintain fast, seamless communication across the team. She values interfaces that provide prioritized alerts, fast data filtering, excellent readability in bright pit-lane environments, and instant access to the most critical insights without unnecessary distractions.

Ethan Brooks: Pit Stop Crew Chief

Ethan Brooks is a 45-year-old British Pit Stop Crew Chief with over 20 years of Formula 1 experience, beginning his career as a race mechanic before advancing into pit crew leadership. He is responsible for coordinating the entire pit stop operation, including tire changes, jack timing, crew synchronization, and safety checks. Working in one of the most intense environments in motorsport, Ethan operates under constant pressure where even a fraction of a second can determine race positions.

Ethan is disciplined, practical, and highly efficiency-driven. He relies heavily on muscle memory, fast reactions, and clear visual cues rather than complex interfaces or excessive data. He values systems that are reliable, direct, and built for high-speed decision-making in loud and chaotic conditions. His leadership style is authoritative and focused on precision, ensuring every crew member performs in sync during critical pit-stop moments.

During races, Ethan uses several connected devices to maintain awareness and coordination. Through his AR headset, he sees live countdowns before the car enters the pit lane, visual alignment guides for crew positioning, and instant safety warnings if equipment is misplaced or unsafe. His smartwatch delivers silent haptic alerts during high-priority situations and provides immediate pit-stop performance feedback after each stop. Using the steering wheel interface, he remotely monitors the driver’s steering wheel status before pit entry and verifies tire modes and energy deployment settings.

Ethan’s primary goals are to execute consistently perfect pit stops, reduce communication errors, improve crew coordination under pressure, and react instantly to unsafe conditions. He becomes frustrated when audio communication is lost in pit-lane noise, timing cues are missed, or

interfaces rely too heavily on text during fast-paced action. He needs systems with large visual indicators, hands-free interaction, color-coded alerts, and ultra-low latency updates that support quick decisions without slowing down the crew.

Aiko Tanaka: Performance Data Engineer

Aiko Tanaka is a 29-year-old Japanese Vehicle Performance Engineer with 6 years of experience in motorsport telemetry systems. She specializes in analyzing live vehicle data during races, focusing on engine temperatures, brake performance, aerodynamics, and energy recovery systems. Working closely with drivers and race strategists, Aiko helps optimize car setup and overall performance by turning complex telemetry into fast, actionable insights.

Aiko is highly technical, detail-oriented, and precision-focused. Although naturally introverted, she collaborates effectively with engineers and strategists when solving performance issues under pressure. She values accuracy, customization, and clean data presentation, often experimenting with advanced visualizations to better understand vehicle behavior and driver performance. She prefers systems that prioritize functionality and responsiveness over visual distractions or unnecessary animations.

Throughout race weekends, Aiko relies heavily on her tablet and AR headset to monitor and interpret live telemetry. On her tablet, she uses multi-layer dashboards to compare sector-by-sector performance, analyze driver consistency, and configure custom data widgets for different race conditions. Her AR headset allows her to visualize engine heat zones and component stress indicators directly on a 3D representation of the car in real time. She can also switch to the

driver’s first-person perspective to better understand handling problems and identify performance limitations during laps.

Aiko’s main goals are to detect mechanical or performance issues before failures occur, improve car efficiency lap by lap, and deliver immediate recommendations to the race team. She also focuses on comparing live driver performance against simulations and predictive models to identify optimization opportunities. Her biggest frustrations include delayed telemetry updates, cluttered interfaces, difficulty correlating multiple data streams quickly, and lacking context during fast-moving race situations. She needs highly customizable interfaces with organized yet data-dense layouts, responsive real-time graphs, and precision-focused controls that allow fast filtering and analysis under pressure.

Lucas Müller: Reserve Driver & Simulator Specialist

Lucas Müller is a 24-year-old German Reserve Driver and Simulator Specialist transitioning from Formula 2 into Formula 1. As part of the team’s performance and development division, he supports race weekends by comparing live driver performance against simulator predictions and testing alternative vehicle setups for future sessions. He often works remotely from the simulator facility, running virtual race simulations in parallel with live on-track events to help engineers and strategists make faster, more informed decisions.

Lucas is competitive, ambitious, and highly adaptable. With a strong technical mindset and a driver’s perspective, he learns quickly through immersive visual feedback and hands-on experimentation. He thrives in high-tech environments where simulation, telemetry, and real-

world racing data intersect. While still building his career as a professional driver, he is deeply focused on improving his understanding of racecraft, vehicle behavior, and team communication under real Formula 1 conditions.

During races and simulator sessions, Lucas relies on multiple connected systems to stay synchronized with the team. Through the steering wheel interface, he mirrors the live driver's steering wheel configuration inside the simulator and experiments with alternate brake balance, tire management, and energy deployment strategies. Using his AR headset, he can enter an immersive cockpit perspective during live laps, viewing racing lines, braking zones, and tire grip overlays in 3D space to better understand driver decisions and track conditions. His smartwatch provides quick race updates while moving between simulator stations and allows him to monitor driver biometrics and stress indicators during long sessions.

Lucas's main goals are to improve simulation accuracy, better understand driver behavior in real race situations, and prepare himself for substitute driving opportunities when needed. He also aims to strengthen communication between drivers and engineers by translating simulator insights into actionable race feedback. His frustrations include delays between simulator data and live race telemetry, limited immersion in traditional analysis tools, inconsistent interpretation of driver feedback, and difficulty understanding race context through raw data alone. He needs systems that provide immersive real-time visualization, ultra-low-latency cockpit streaming, fast transitions between simulation and live race modes, and clear tools for comparing performance data across drivers and scenarios.
